

Milestone 3

Progress is coming along well, I haven't started making the actual site yet, that part shouldn't take too long to make. For the frontend of the website I am planning on using the Materialize framework because one, I'm familiar with it two, the jquery libraries associated with it allow for easy smooth functionality without a large cost to time. Along with jquery i'm planning on using the three.js library to render my models in real time.

As far as the database goes I want to keep it simple because in the end this is just a portfolio site, I think having a comment section and a simple registration system would be appropriate for what I'm aiming at. Visitors to the site will be able to register their name and email if they wish to comment on the models on display. These comments as well as user info will be stored in the database.
