

Milestone 1

So I'm thinking that a good project at this point would be to create a web page that doubles as a portfolio and have a database that stores all of my renders from my Blender independent study and maybe if this is at all possible have the ability to display the actual 3d scenes in realtime on the site so the user can move them around and interact with them.

sketchfab.com has a feature when you're looking over the gallery where to model will rotate around the frame depending on where the cursor is located. I think this would be a nice piece of interactivity to the site and overall be a good idea for a final project.
