Milestone 4 Web Tech

Progress is coming along with my final project for Web Tech 2020. At this point I have all the tools and knowhow to implement everything. MY site will function first and foremost as a portfolio site but will have database functionality. There will be a signup system and a table that holds comments made on the site. Finally, I think I'm going to try to store my models on the data base just to further make use of the backend for this project I also think that if the model's were stored on a database versus a file tree it would greatly speed up load times, Could be wrong but i'm going to give it a shot for the sake of this class.
